Century Products Builds Their Largest Hole Openers to Date

Since the company's beginnings in 1982, Century Products has evolved into a full-service provider of HDD tools and drilling fluids. Moving forward in the industry, Century is proud to have revolutionized the rock-reaming world with the strongest and most technologically advanced Hole Opener to date.

Century Products recently built two 60" Hole Openers for a client's sewer pipeline project in Connecticut. Century's revolutionary design includes a precision-machined solid body welded to a hardened shaft. Arm and cone assemblies machined from solid aircraft quality steel are lowered into place and welded for superior strength. It is this revolutionary design that enables the replacement of arms and cones for continued use.

The 60" Hole Openers were the largest built to date by Century Products. The Century designed hole openers included eight 22" tungsten carbide inserts designed for softer rock conditions. A stabilization ring located ahead of the TCI cutters helped maintain a smooth cutting rotation.
